What I Learned

Through this mini-project, I learned how to create a personal study website about Python using Lovable and develop an AI chatbot using Dify. I understood how to design a website, organize learning materials, and make information easy to access. I also learned how chatbots can answer questions and help us learn more effectively. By working with these AI tools, I gained practical knowledge about website creation and artificial intelligence without needing advanced coding skills. This project improved my creativity, problem-solving skills, and confidence in using new technologies. Overall, this mini-project helped me understand how AI tools can make learning easier, faster, and more interesting for students. It was a valuable learning experience that encouraged me to explore more about AI and machine learning in the future.
